Quiz3

Given a List<Customer> and a SQL statement as follows:
SQL statement: SELECT name FROM customers WHERE city = 'London'
And a Customer class with the following properties:
class Customer {
    private int id;
    private String name;
    private String city;

    // Getters and setters
}
Write a Java method using functional programming and Stream API that takes a List<Customer> and a String city name as parameters and returns a list of Customers names who live in the specified city, equivalent to the SQL query.
